

Improved Export of Tracks, Routes, and Trips

We've upgraded the export engine for GPX, KML, and PLT files.

Exported files now match the data displayed on the map more accurately than ever before.

What's improved?

- Individual track segments are exported correctly.
- Waypoints and delayed GPS coordinates are now included properly.
- Better support for GPS trackers with onboard memory that store location data offline and upload it later when a connection becomes available.

We've also improved the export of additional track information, including:

- Date and time
 - Altitude
 - Speed
 - Course (heading)
- (when these values are available in the original track).

In addition, the generated GPX, KML, and PLT files now follow their official specifications more closely, providing better compatibility with GPS navigation software, mapping applications, and route analysis tools.

Your exported tracks are now more accurate, more complete, and easier to use in third-party applications.
