

LiveGPS Travel Tracker Updated to Version 4.5.1

A new version of LiveGPS Travel Tracker **4.5.1** is now available.

The update has been released on

- [Google Play](#),
- [Huawei AppGallery](#).

As usual, you can also download the latest version directly from the [official LiveGPS Travel Tracker page on our website](#).

Version 4.5.1 includes a major update to many parts of the app. Some changes are immediately visible, while others improve how the app works internally - including performance, memory usage, GPS handling, and compatibility with newer Android versions.

What's New

LiveGPS Travel Tracker now **supports Edge-to-Edge**, allowing the interface to use the full available screen area and work correctly with the latest Android UI requirements.

The app has also been **adapted for Android 16 and Android 17**.

We have made several **improvements to photos and the map**. Map movement while travelling is now smoother, and photos can be previewed directly on the map.

A lot of work also went into the app's internal performance. We removed unnecessary interface operations and updates, reduced extra processing, and optimized memory usage. This is especially important during long trips, when LiveGPS Travel Tracker may remain active and record a journey for many hours.

GPS Fixes

On some devices, the app could incorrectly detect the number of available GPS satellites. This could make LiveGPS Travel Tracker report a lost GPS signal even though the device was still receiving location data.

This issue has been fixed.

Time and Time Zones

We fixed several issues related to time zone handling and the calculation of a new day. These changes improve how recorded tracks and travel data are assigned to the correct dates.

Additional Fixes in 4.5.1

After the test release of version 4.5.0, we continued testing the updated app and fixed the issues we found.

Version **4.5.1** also includes:

- improvements to the app update module;
- a fix for an issue that could prevent the app from starting automatically after a device reboot;
- fixes for other issues identified after the release of version 4.5.0.

This is one of the larger LiveGPS Travel Tracker updates we have released recently. A significant part of the app has been reworked internally, several long-standing issues have been fixed, and areas that could previously behave inconsistently or use unnecessary resources have been improved.

If you haven't updated LiveGPS Travel Tracker recently, we recommend **installing the latest 4.5.1 version**.
