Mobile Dispatcher 3.5.0 for Android

Version 3.5.0 updates the map screen and tracker management. The device list and its main actions are now in one panel, and tracker cards make it easier to see when a device last checked in and whether a location is available.

What's new

Devices panel. Select a tracker, show all devices on the map, or add a new one. The same panel gives you access to tracker management, the event log, reports, and the option to navigate to the selected tracker.

Tracker cards and statuses. The device list shows each tracker's connection status and last activity. If a tracker checks in without sending new coordinates, the app shows the last contact time and the last GPS fix time separately. A message appears on the map when no coordinates are available.

Map controls and landscape layout. We updated the zoom, centering, and phone location controls and fixed how tracker icons rotate in heading mode. In landscape, Geofences, Devices, and History are on the right. New shortcuts provide quick access to Settings, Stationary Objects, and Account.

Routes and track history. We fixed an issue where an outdated route could appear after switching trackers or canceling navigation. We also fixed excessive zoom when the tracker is nearby. You can now view track history while navigating to a tracker, and we improved track loading and date selection.

ArcGIS satellite map. We improved how the satellite map displays at high zoom levels.

Geofences and settings. We improved quick geofence setup and the map preview. We also updated language and theme selection, the connection to hosted platforms during first-time setup, and the app's update checks.

Changes to maps and refresh settings

- Both CartoDB maps have been removed. If you had either one selected, the app will switch to Mapnik.
- The legacy offline map mode based on cached maps has been removed. MapsForge is still available as a separate offline map option.
- The app now checks for location updates every 10 seconds. The separate refresh interval setting has been removed.

As usual, you can install or update Mobile Dispatcher through

- Google Play

or

- download the APK from the official app page on the LiveGPSTracks website.
