

What is Real Time GPS Tracker?

The application is designed for real-time monitoring of mobile objects. The principle of operation is based on the work of hardware GPS trackers: collecting coordinates and various parameters (speed, distance, battery charge, etc.) and sending them to the server at a specified interval for display on the map of the monitoring service.

Real Time GPS Tracker application turns your smartphone into a GPS tracker device.

Once started, you can close or minimise the application and it will continue its work in the background.

The application has a large number of different settings, with the help of which it is possible to implement a variety of different modes of operation, allowing you to balance online tracking, the quality of the recorded track and saving battery power smartphone. The application can also be fully managed from your personal account on the monitoring server, via SMS commands or special management applications.
